Influence of Toad Parotid Gland Secretion from Indian Toad (*Bufo melanostictus*) in Diabetic Rats: An Experimental Evidence of P-Glycoprotein Inhibition

Naveen Kumar Madugula¹ and Prasad Neerati¹*

¹DMPK Division, Department of Pharmacology, University College of Pharmaceutical Sciences, Kakatiya University, Warangal, Telangana-506009, India.

Authors’ contributions

This work was carried out in collaboration between both authors. Author PN designed the study, performed the statistical analysis, wrote the protocol and wrote the first draft of the manuscript. Author NK managed the analyses of the study. Author NK managed the literature searches. Both authors read and approved the final manuscript.

ABSTRACT

The study was conducted to improve the oral bioavailability of glyburide (GLY) with Indian Toad Parotid Gland Secretions (TPGS). P-glycoprotein is an efflux transporter cellular protein and effluxes xenobiotics and drugs to the outside of cells lead to decreased concentration of drugs at the target site. P-gp inhibitors essentially increase the levels and there is a need for new P-gp inhibitors to develop for the improvement of the oral bioavailability of P-gp substrate drugs because the existing inhibitors have serious side effects. This study was aimed to describe the P-gp inhibitory action from TPGS, *Bufo melanostictus*, in diabetic rats by using glyburide as p-gp substrate. Acute toxicity studies showed 300 mg/kg as toxic dose and 50 mg/kg was selected as study dose according to OECD 423. LC-HRMS study conducted to identify the new compounds. Apparent permeability (P_{app}) was estimated by non-everted sac method (*In Vitro*) with rat jejunum.

*Corresponding author: E-mail: prasadneerati@gmail.com, prasadneerati@kakatiya.ac.in;
and ileum to confirm the P-gp inhibitory activity of TPGS by using fexofenadine (FEX) as P-gp substrate. In in-vivo protocol rats grouped into 4 groups (n=6), the first one is normal, second diabetic, third GLY 30 mg/kg, and fourth group GLY+ TPGS, 50 mg/kg for the single and multiple-dose treatment study. The spectrometric analysis revealed the new compounds, and TPGS P_{app} (X10^{5} cm/s) in rat jejunum and ileum was significantly increased from 2.0±0.1 to 6.4±0.3 and 1.2±0.3 to 3.0±0.3 respectively. Blood glucose concentration in rats more than 250 mg/dl were considered as diabetic and in single, multiple-dose interaction studies (SDI, MDI) the concentrations decreased from 140.0±2.0 and 122.0±2.2 μg/dl respectively. The pharmacokinetic parameters like C_{max}, Cl and in SDI, MDI and significant increase of C_{max} and AUC; and decrease of Cl was observed. The above results conclude that TPGS had the potential P-gp inhibitory activity and improved the oral bioavailability of GLY significantly. Subsequent experimentation is warranted to chemically characterize the compounds from TPGS as potential new P-gp inhibitors.

Keywords: Toxins from TPGS; LC-HRMS; Bufo melanostictus; P-gp; Glyburide.

1. INTRODUCTION

Inoculation of the venom system was not developed by the toads, even though they are treated as venomous animals as they secrete highly toxic venomous emanations from their skin. Toads contain alveolar mucus and acinar granular glands with different types of functions [1,2]. Frogs and toads skin, glandular secretions contain bioactive host-defensive molecules from Australian anurans and, there are several types of glands available for the secretion of these compounds [3-5]. These natural compounds with biological activities like anti-bacterial, anti-inflammatory and anti-cancer activities [6-11] are reported surprisingly there are no studies on Indian Toad secretions. Therefore, as these secretions are unique resources for novel drug development we conducted this study for the first time with Indian Toads. The secretions from mucus gland contain to make the skin slippery as well as prevent its mechanical damage by some materials [12,13] and mucous control the body-surface P_{H} and also maintain skin moisture [14]. These secretions are bacteriostatic, can trap microbial and fungal pathogens and also protect from an adverse effect of prolonged contact with water and slow down the evaporative loss of water. Xenopuslaeris, a type of African frog contain different types of mucins with different functions [15]. The well-developed parotid glands in toads are present in Buffo and some other species on the skin and secrets mucins [16]. Surprisingly different types of compounds produced from toads and frogs like peptides, steroids alkaloids and many other uncharacterized toxins with a variety of biological activities [17,18]. Toxins from toads and frogs secretions proved to possess cardiotoxic, nicotinic and neurotoxic, vasoconstrictive, hypotensive, hallucinogenic effects along with their harmful effects to their predators. Upon systematic investigations of these secretions will be helpful to develop new chemical entities [19]. Permeability glycoprotein (P-g) is a protein that efflux out the drugs and chemicals to the outside of cell likely to be present on all cells acts as a defence mechanism against harmful substances and is ABCB1 gene-encoded [20,21].

Many of the drugs are P-gp substrates, because of its effect their concentrations inside the cell not maintained and if any P-gp inhibitor is given in combination, it will elevate the intracellular concentration. P-gp inhibiting drugs increase the concentration of the drugs those are substrates of P-gp and thus enhance the pharmacological and/or toxicological effects of the substrate drugs. Glyburide (GLY) is a P-gp substrate, and Indian toad parotid gland secretion (TPGS) if exhibits P-gp inhibitory effect, there may be the possibility to alter the pharmacokinetics and pharmacodynamics and improve the oral bioavailability of GLY.

2. MATERIALS AND METHODS

Acetonitrile (Merck, Mumbai), methanol (Merck, Mumbai), Glyburide, (Sigma Aldrich, Bangalore), Potassium dihydrogen phosphate (Sigma Aldrich, Bangalore), Glucilazide, Fexofenadine (Aurobindo labs), Streptozotocin (Sigma Aldrich, Bangalore), Glucose kit (GOD-POD-KIT) (Viola, Mumbai). Types of equipment used are, HPLC (contains C18 column coated with 5 micron particles), Biofuge (Herawein instrument- Germany), Micropipettes (Torsons), Microcentrifuge tubes (Tarsons), Butterfly catheter, Ultra sonicator. LC HRMS (Instrument: Agilent Technologies, Modal: 0530).
2.1 Animals

Wistar rats procured from Mahaveer Enterprises, Hyderabad, acclimatized then used, with standard diet and water ad libitum, and 12 hours fasting was maintained before the start of the study.

2.2 Sample Collection and Preparation

Adult live Indian Toads (40-50 grams), Order- Anura, family- Bufonidae, genera- Bufo, subgenera- melanostictus were collected from the near vicinity of Kakatiya University, Warangal. Bufonidae includes more than 300 species the family includes 25 genera and the above-selected species was authenticated by Zoology professor YV from our university. TPGS was freshly obtained by compressing the parotid glands by milking process (it oozes out as white mass) with the help of forceps and hands aseptically from living individual’s secretions were collected on the surface of glass Petri plates and it’s containing dried extract was used in the study [22-24] and the Toads were released to live.

2.3 Spectrometric Analysis Study by LC-HRMS

The aliquots of TPGS was dissolved in methanol and subjected for LCHRMS study mass spectra were recorded by Electron Spray Ionization -ESI [25] in the positive ion mode by direct infusion. The Q-TOF MS used a quadrupole (four parallel rods arranged in a square formation), a collision cell, and a time of light unit to produce spectra. Lighter ions accelerate faster down the flight tube to the detector thus determining the ions mass-to-charge ratios.

2.4 Toxicity Assessment

TPGS suspended in water and toxicity findings were done under OECD guidelines in female Wistar rats. Animals separated to (4 groups, n=3) normal saline-treated group, TPGS 5 mg/ kg/p.o treated group, TPGS 50 mg/kg/p.o treated group and TPGS 300 mg/ kg/p.o the treated group, then observed for the possible toxicity up to 48 h. The mortality was noted to determine the lethal dose of TGPS [26-28].

2.5 In Vitro Study

2.5.1 Non-everted sac method

Rats were grouped up to 4 (n=4) after overnight fasting intestines were isolated under anaesthesia by using thiopental sodium (50 mg/kg/i.p), and ice-cold saline was used to flush. The rats were exsanguinated, the jejunum and ileum portions isolated and a segment of each was cut into a length of 10 cm for preparation of the sac for the experiment. First group intestinal sacs were loaded with 500 µg/mL of fexofenadine (FEX) a P-gp substrate alone and, second FEX+Verapamil (VER) as an inhibitor, third FEX+TPGS 1000 µg/ml and fourth FEX+TPGS1500 µg/ml was included in the sacs for the study protocol and apparent permeability coefficient (P_app) was calculated [29].

2.6 In Vivo Study

Rats were subjected for induction of diabetes and more than 200 mg/dl glucose concentration was selected as diabetic [30].

2.6.1 Pharmacodynamics and pharmacokinetic interaction study in diabetic rats

Animals were grouped into four different sets like first as normal control, the second set as diabetic control, third set as glyburide treated and fourth set as GLY+ TPGS treated. The treatment is given for seven days; the interaction study was done with an initial day as a single dose and on the seventh day as a multiple-dose study. At the present, time points blood sampling was done from tail vein (0, 0.5, 1, 2, 4, 6, 8, 12 and 24h), at predetermined time intervals between by using butterfly catheter (23GB). Serum was separated by centrifugation. Blood glucose concentrations were estimated by GOD-POD method [31], and pharmacokinetic parameters estimated.

2.7 Pharmacokinetics Evaluation

2.7.1 HPLC description

A Shimadzu Class VP series HPLC system with two LC-10AT pumps, an SPD-10A variable wavelength programmable UV/VIS detector, an SCL-10A system controller and an RP C-18 column (Merck, Hiber; 250 mm×4.6 mm; particle size 5 μm) was used. The system was equipped with N2000 software. The mobile phase consists of 60:40 v/v acetonitrile: monobasic potassium dihydrogen orthophosphate (pH 3.5 adjusted with phosphoric acid) at 60:40 v/v ratios was run by the isocratic system through the reverse-phase analytical column and gliclazide was used as an internal standard [32]. The flow rate was 1 ml/min and the effluent was monitored at 253 nm. The total run time of the method was set at 15 min.
2.8 Statistical Analysis
Analyzed the data help of WinNonlin 6.2 software and Graph Pad Prism software version 8.4.2, two way ANOVA (Bonferroni post-test) was used for statistical analysis and the values are explained as mean±SD.

3. RESULTS

3.1 Spectrometric Analysis Study by LC HRMS
The presence of parotid gland is depicted in the Fig. 1A.

The following mass followed by the proposed molecular formula was obtained from LCHRMS studies with TPGS. They are 125.9864 ([C4 H N2 O S] +H) +, 160.0752 ([C10 H9 N O] +H) +, 219.1488 ([C13 H18 N2 O] +H) +, 261.0430 and are shown in Fig. 1B.

Whereas molecular formulas found from 300 to 600 range are ([C9 H6 N7 O S]+H)+, 363.1107 ([C21 H16 N O5]+H)+, 437.2082 ([C15 H31 Cl N9 O2 S]+H)+, 539.1929 ([C21 H24 N13 O3 S]+H)+, 579.2921 ([C30 H38 N6 O6]+H)+ and shown in Fig. 1C.

Further the proposed molecules with molecular formula in the range of 600 to 800 are 643.3939 ([C33 H46 N12 O2]. +H) +, 685.4066 ([C40 H59 Cl N O6] +H) + and are shown in Fig. 1D.

3.2 Toxicity Assessment
The mortality was observed with TPGS 300mg/kg and maximally tolerated dose (MTD) was decided as 50mg/kg/p.o. Table 1.

3.3 In Vitro Study
TPGS $P_{app}$ (X10$^{-6}$ cm/s) in rat jejunum and ileum was significantly increased from 2.0±0.1 to 6.4±0.3 and 1.2±0.3 to 3.0±0.3 respectively Fig. 2A.

3.4 In Vivo Study
Blood glucose concentration in rats more than 250 mg/dl were considered as diabetic and in single, multiple-dose interaction studies (SDI, MDI) the concentrations decreased from 140.0±2.0 and 122.0±2.2 µg/dl respectively Fig. 2B.

The pharmacokinetic parameters like $C_{max}$, $Cl$ and in SDI, MDI significant increase of $C_{max}$ and $AUC_t$ and decrease of $Cl$ was noticed. $C_{max}$ of Gly was increased from 1.725±0.299 µg/mL to 4.300±1.160 µg/mL, 7.600±1.071 µg/mL with Gly +TPGS single dose Fig. 3A.

4. DISCUSSION

Diabetes needs lifelong treatment for the optimal blood glucose concentration to maintain and if not maintained, it may result in other several disorders which affect the major organ systems in the body. Frogskin glands proved to have many potential compounds with pharmacological effects [33,34]. LC HRMS study showed the presence of new chemical entities with a wide range of mass starting from 100 -900. In an in-vitro study, FEX P-gp substrate [35], and TPGS as testing inhibitor were used with jejunum and ileum, to confirm the P-gp inhibitory potential. This study evidenced that FEX, P\textsubscript{app} was increased with VER as P-gp inhibitor [36] and also with different concentrations of TPGS on jejunum and ileum indicates the P-gp inhibitory effect of TPGS these results are comparable with previous studies[37]. P-gp inhibitors can improve the oral bioavailability of P-gp substrate drugs [38-41] significantly similar to these results our results are correlated for the improvement of oral bioavailability of GLY a P-gp substrate drug and TPGS as P-gp inhibitor. The current study was undertaken to determine the antidiabetic potential of compounds derived from TPGS by using GLY as a P-gp substrate and to investigate the influence of TPGS on the absorption kinetics of GLY in STZ induced diabetic model. The enhanced absorption of GLY was due to P-gp inhibition by TPGS. Enhanced oral bioavailability by TPGS is related to the inhibition of P-gp substrate drugs by P-gp inhibitors [42,43]. TPGS enhanced the oral pharmacokinetics of GLY suggesting that combined use may reduce the efflux of GLY. This indicates that natural compounds from Indian Toad may inhibit the P-gp driven GLY pumping outside the cell to some extent.

5. CONCLUSION

TPGS was found to be lethal at 300mg/kg. Shown to have P-gp inhibitory activity and enhanced the oral bioavailability of GLY. These results conclude that TPGS is a good source of the new chemical compounds of scientific interest to develop novel P-gp inhibitors. Further studies are warranted to isolate pure compounds as new chemical entities with potential pharmacological activities.

This study gives the scope for further exploring the systematic isolation of new chemical compounds to explore the mechanism of action of TPGS and also their interactions with other P-pg substrate drugs.

CONSENT

It is not applicable.

ETHICAL APPROVAL

The protocol was approved by the Institutional Animal Ethical Committee, Kakatiya University, Warangal (IAEC/15/UCPSc/KU/2018).
