ABSTRACT

Introduction: Diabetes mellitus and its complications are spreading with increased rate in Asian population especially in Pakistan. Uncontrolled diabetes can lead to different micro vascular complications. Cataract is one of the complications of diabetes which may lead to lens degenerative changes and visual impairment. G6PD plays a vital role in preventive measurements from cataract development in normal population.

Objectives: This Study was designed to estimate G6PD levels in diabetic without ocular manifestations & diabetic cataract population.

Methodology: This cross sectional comparative study was done at the Department of Biochemistry LUMHS Jamshoro in collaboration with the Diabetic clinic, Institute of Ophthalmology & Diagnostic

* BDS, MSc (OMFS);

Research Laboratory LUMHS Jamshoro. 100 diagnosed subjects of diabetes were selected by Non-Probability type of sample technique with consent of subjects and they were divided in to two groups Group A as control 50 diabetic subjects with out ocular manifestation while Group B as case study group contain 50 subjects of diabetes with cataract. The fasting blood glucose level was estimated by Hexokinase Method while G6PD level was measured by kit method on SD Biosensor while HbA1c(%) was estimated by TTAB methodology. The data was statistically analyzed by SPSS 21.

**Results:** The mean level of G6PD in Group A was 15.63±2.45 u/Hb while in group B it was 9.01±3.11 u/G HB. This result finally concluded that there was significantly (<0.05) decline of G6PD level in diabetic cataract as compared with diabetic without cataract.

**Conclusion:** This study concluded that there was significant decline in G6PD level in diabetic population.

The oxidative injury plays vital role to the development of cataract as compared with non diabetic population [8]. The incidence of diabetic cataract rising all over the world due to elevated prevalence of diabetes mellitus all over the world. Diabetic cataract is directly proportional with the duration of diabetes mellitus and poor glycemic control [6,9]. The oxidative injury plays vital role in development of cataract in diabetic population [10]. Glucose 6 Phosphate Dehydrogenase (G6PD) enzyme is the first enzyme of Hexose Monophosphosphate (HMP) shunt which produce redox pair potential which is preventable measurement against oxidative injury [11,12]. So maintaining the normal concentration of G6PD is the key factor for prevention or delay development of cataract in diabetic population [13].

In this study we evaluate the concentration or level of G6PD in the patients of Diabetic cataract.

**Keywords:** Diabetes mellitus; diabetic cataract; G6PD.

**1. INTRODUCTION**

The Diabetes Mellitus is one of the leading cause of morbidity and mortality of Pakistani population [1]. The Pakistan included in top ten countries of the world with leading diabetes mellitus as mortal and morbid clinical syndrome [2]. The International Diabetic Federation (IDF) estimated that more than 4 millions people are suffered with diabetes mellitus all over the world [3]. The different pathological, metabolic and micro vascular disorder can occur as complications of diabetes mellitus [4]. Uncontrolled and prolonged duration with diabetes can be one of the leading cause of visual impairment and ocular complications like diabetic cataract, diabetic retinopathy etc [5,6]. Visual impairment is one of the complaint of diabetic cataract [7]. The diabetic patients are 5 to 7 times more prone to development of cataract as compared with non diabetic population [8]. The incidence of diabetic cataract rising all over the world due to elevated prevalence of diabetes mellitus all over the world. Diabetic cataract is directly proportional with the duration of diabetes mellitus and poor glycemic control [6,9]. The oxidative injury plays vital role in development of cataract in diabetic population [10]. Glucose 6 Phosphate Dehydrogenase (G6PD) enzyme is the first enzyme of Hexose Monophosphosphate (HMP) shunt which produce redox pair potential which is preventable measurement against oxidative injury [11,12]. So maintaining the normal concentration of G6PD is the key factor for prevention or delay development of cataract in diabetic population [13].

This cross sectional comparative study was carried out at the Department of Biochemistry of LUMHS Jamshoro with collaboration of diabetic clinic LUMHS, Institute of Ophthalmology UMHS and Diagnostic & Research Laboratory LUMHS Jamshoro Sindh. Total 100 diabetic patients were recruited for this study which was divided in to two groups; group A which contained 50 diagnosed cases of type 2 diabetes mellitus without ocular manifestation consider as control group while group B contained 50 diagnosed cases of type-2 diabetes mellitus with development of cataract considered as case study group. Each subject was recruited by applying Non Probability type of sample technique with consent of the subjects. The diabetic patients with in age between 40 to 50 years with history of diabetes at least from last five years both males and females were included while patients of type-1 diabetes mellitus, below age of 40 years or above 50 years, patients of senile cataract and renal disorder were excluded from this study. Total 10 ml of venous blood was collected under aseptic measure for the estimation of fasting blood glucose level, G6PD level and HbA1c%. Serum fasting blood glucose levels was measured by hexokinase method applying at Hitachi Cobas C 501 analyzer D&R laboratory LUMHS while G6PD was analyze by kit method on SD Biosensor, Inc. Republic of Korea.Tetra-decyl-Tri-methyl-Ammonium Bromide (TTAB) methodology was used to analyze the HbA1c% on Hitachi Cobas analyzer. Data was statistically analyzed by SPSS version 21 by applying of Student pair t test and chi square test.

**2. METHODOLOGY**
3. RESULTS

Total 100 diagnosed cases of type-2 diabetes mellitus recruited and divided into two groups; each group contained 50 diagnosed cases of type-2 diabetes mellitus, group A contained 33 males and 17 females diabetic patients without ocular manifestation, while group B contained 28 males and 22 males diabetic patients with ocular manifestation means diagnosed cases of diabetic cataract. Three biochemical parameters (fasting blood glucose level, HbA1c% and G6PD) were analyzed. The mean values of understudy variables are provided in Table 1, together with their significant values. In this table, there is no significant difference in fasting blood glucose levels or glycemic control index between the two groups, however the level of G6PD declines considerably (p=0.05) more in group B with diabetic cataract than in group A with diabetes without ocular manifestation.

4. DISCUSSION

The development of cataract is earlier in diabetic population as compared to non diabetic population [14]. Poor glycemic control and long duration of diabetes are the main risk factors for the development of diabetic cataract [5]. The elder age cataract may be irreversible while the cataract developed in young diabetic patient can be reversible in nature [15]. The reduction of glucose molecules into sorbitol by help of aldose reductase enzyme is the central mechanism for development of cataract this pathway also known as polyol pathway [16]. In the polyol pathway there is degeneration of lens due to hyperosmotic effect due to intracellular accumulation of sorbitol at membrane [17]. This mechanism stronger in diabetic population because there is quick conversion of sorbitol in to fructose by help of sorbitol dehydrogenase enzyme so diabetic population more prone to development of cataract as compared to general population. Another explanation for cataract formation in diabetics occurring sooner owing to early degenerative alterations in lens protein is this process [14,16,17]. Glucose 6 Phosphate Dehydrogenase (G6PD) is the main regulatory enzyme for this function. G6PD provides redox potential which maintain the normal structure of lenticular proteins.

Fig. 2. HbA1c% Control & Case Study Groups

Fig. 3. G6PD (mg/dl) Control & Case Study Groups
Our study shown that there is statistical significant (P<0.05) decline in G6PD levels in diabetic cataract group as compared to diabetic without cataract group.

G6PD deficiency in diabetic cataract first observed by Orsalezi et al. [18] they reported that there was significant decline in G6PD compared with general population.

Our study also supported by the study of Lee et al. [19] they also concluded that G6PD level decline (P<0.001) in diabetic cataract compared with non diabetic population.

Oleniyan et al. [20] also reported that there was significant decline in G6PD level in diabetic population with vascular complications as compared with diabetic population without vascular complications. This study also suggested that when blood glucose level increased it causes phosphorylation of G6PD enzyme by activation of Protein Kinase A which reduces the level of G6PD in diabetic population.

5. CONCLUSION

This study concluded that there was significant decline in G6PD level in diabetic cataract. It is also concluded that the estimation of G6PD level in diabetic population will be beneficial to take early preventive measurements against diabetic vascular complications.

6. FUTURE RECOMMENDATION

We believe that in the future, a bigger sample size will be required to ensure the veracity of the results.

DISCLAIMER

The products used for this research are commonly and predominantly use products in our area of research and country. There is absolutely no conflict of interest between the authors and producers of the products because we do not intend to use these products as an avenue for any litigation but for the advancement of knowledge. Also, the research was not funded by the producing company rather it was funded by personal efforts of the authors.

CONSENT

As per international standard or university standard written consent has been collected and preserved by the author(s).

ETHICAL APPROVAL

As per international standard or university standard written ethical approval has been collected and preserved by the author(s).

COMPETING INTERESTS

Authors have declared that no competing interests exist.
